4 VERSION HISTORY 5

1. PURPOSE

This document provides the steps to Mount CIFS share in *FIAUS01* servers hosted in HP-Unix environment.

2. SCOPE

2.1. Inscope:

2.1.1 We will receive RITM/Incident from SAP Basis team While they are facing Issue while accessing “/mnt/windows/offline” directory

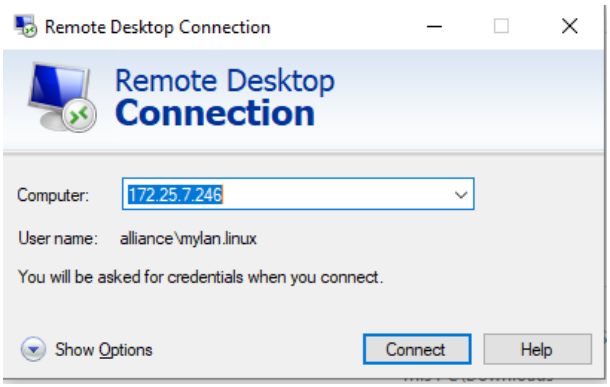

2.1.2 If we receive email from SAP Basis team, we will ask them to raise a Incident Request

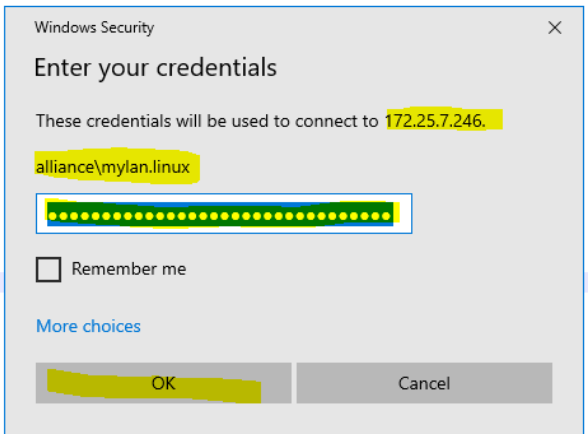

2.2. Out of scope:

2.2.1 Issue related to CIFS user credentials

3. PROCEDURE

3.1 The server “FIAUS01” was hosted in Isolated network. We have to reach the server by accessing Window Ascends jump server “172.25.7.246”.
Login to Ascends jump server “172.25.7.246” with below credentials:
Computer name: - **172.25.7.246**
Username: **alliance\mylan.linux**
Password: **]K^{<-R>Qe%7fd\5CbrL=UC3Y_9se^Y8**

3.2 Login to the server ““FIAUS01*”* using putty utility with below credentials:

IP address: 10.118.255.9
Username: root
Password: spinisa999

3.3 Check whether the Filesystem “**/mnt/windows”** was mounted or not by executing below command

bdf /mnt/windows

```
root@fiaus01:()> bdf /mnt/windows
Filesystem          kbytes    used   avail %used Mounted on
akhisabex01.alliance.net:/sap_backup
                    1758083064 1682075144 76007920   96% /mnt/windows
root@fiaus01:()>
```

Note: Skip the step 3.4, if Mount point was not exists.

3.4 If the mount point is existing, then check whether are you able to touch any file inside the filesystem or Not.

```
fiaus01:p2aadm 13> pwd
/mnt/windows
fiaus01:p2aadm 14> ls -ltr
total 48
-rw-r--r--   1 p2aadm     sapsys        6360 Oct 27 12:46 trans.log
-rw-r--r--   1 p2aadm     sapsys       10915 Oct 27 13:29 sqlnet.log
fiaus01:p2aadm 15>
```

3.5 If the filesystem was not mounted, then Execute below command to mount the filesystem with credential shown below:
Username: administrator
Password: P@ssw0rd

cifsmount akhisabex01.alliance.net:/sap_backup /mnt/windows -U administrator

```
root@fiaus01:()> cifsmount akhisabex01.alliance.net:/sap_backup /mnt/windows -U administrator
```

3.6 Repeat the step 3.3 and 3.4 to validate Filesystem is accessible.

```
root@fiaus01:()> bdf /mnt/windows
Filesystem          kbytes    used   avail %used Mounted on
akhisabex01.alliance.net:/sap_backup
                    1758083064 1682075144 76007920   96% /mnt/windows
root@fiaus01:()>
```

3.7 Once File system was mounted and it was accessible, Then Switch to the user p2aadm from root user and login cifs Filesystem.
su - p2aadm

```
root@fiaus01:()> su - p2aadm
```

Execute below command to login CIFS share with below credential:
Username: administrator
Password: P@ssw0rd
cifslogin akhisabex01.alliance.net -U administrator

```
root@fiaus01:()> cifslogin akhisabex01.alliance.net -U administrator
```

3.8 Logout from the user session p2aadm

3.9 Now Check the CIFS share Login status by executing below command
cifslist -u

```
root@fiaus01:()> cifslist -u
Server            Local User        Remote User       Domain            State
------------------------------------------------------------------------------
akhisabex01.allia root              administrator                       L
akhisabex01.allia p2aadm            administrator                       LS
akhisabex01.allia orap2a            administrator                       S
```

So at this point, the state of that connection shows up as **LS**.

***Note**: Key to State symbols:*

M Mounted

R Read-only

L Logged in

S Stored in database

3.10 Repeat the step 3.5 to 3.7 to login CIFS share as the user “orap2a”, then Check the CIFS share Login status by executing below command

cifslist -u

```
root@fiaus01:()> cifslist -u
Server            Local User        Remote User       Domain            State
------------------------------------------------------------------------------
akhisabex01.allia root              administrator                       L
akhisabex01.allia p2aadm            administrator                       LS
akhisabex01.allia orap2a            administrator                       LS
root@fiaus01:()>
```
