1. PURPOSE

This document describes providing privileged User access (SUDO) to a local system user account in UNIX servers.

2. SCOPE

2.1. The user account must exist in the server to provide SUDO (privileged) access, if not requester raise smart shop request to create their own account in Unix system

2.2. SUDO access can be provided to Local user account to install and upgrade of Application or database.

2.3. SUDO access can be granted temporary by 3 days against Smartshop RITM request.

2.4. Based on the exceptional approval, SUDO access can be extended as per the end date mentioned by the exceptional approver

3. PROCEDURE

3.1. The Requester will raise a UNIX User management Smart stop request to get SUDO access.

3.2. Once Requestor first level manager approves, Automation flow will route the request to Unix SME approval (for external temporary workers second level manager approval as well)

3.3. Unix SME will validate the request, if the justification meets the requirement for SUDO access, then the request will approve.

3.4. Once UNIX SME is approved, the Automation flow will execute the SUDO access request in the respective server.

3.5. Automation flow will send an email communication to the requestor.

3.6. If the user account was not available in the UNIX system, the request will fail, and a notification will send to the requestor by automation flow

3.7. The requestor can raise a UNIX user management Smart Stop request to account creation and SUDO access in same request.

4. EXCEPTIONAL APPROVAL:

4.1. Exceptional approval applicable for below conditions:

- SUDO access requirement more than 3 days
- Server CI (Configuration Item) status in NEW
- Application not installed in the server
- Server GXP sensitivity is No

4.2. The Exceptional approver will approve the SUDO access request with the end date of SUDO access requirement. The exceptional approver must be L2 lead of the requestor.

4.3. If the end date was not mentioned in the approval email. It will not be valid to proceed Exceptional SUDO access request.

4.4. The Exception approval for SUDO access without end date must be approved by CIO.

4.5. The requestor will raise a general service request with Exceptional approver email as an attachment and assign it to Unix Run Team

4.6. Unix Run team will execute the SUDO access request manually.

4.7. Once Request completed, Unix run team will send a communication to requestor via ServiceNow.

4.8. If the user account was not available in the UNIX system, the request will fail, and a notification will send to the requestor to raise a Smart Stop request to create his/her account in the Unix system

5. DEFINITIONS:

RITM	General service request
Exceptional approver	L2 Lead of the requester or CIO
SUDO	Super users do – privilege access to perform any action
SME	Subject Matter Expert
